I really enjoyed this class. I feel like I've learned a lot, and definitely have a ton of new skill sets that I know I'll be using in all my future projects. This class really taught me a lot about Figma, Fluid Grid, and Bootstrap. Those are definitely the biggest takeaways that I know I will use constantly while still in school, and out in the workplace.

Figma was definitely one of my favorite new skill sets. Apart from what we discussed in class, I also found some really helpful tutorials online, that help further my understanding a lot. Now I not only use it for my web classes, but also in my design classes. After getting the hang of it, it became a regular part of my workflow. I don't think there will ever be a project I do without using it.

Bootstrap is another tool that I can see myself using quite frequently. I'm not sure if I want to use it too heavily just yet. I just want to make sure my skill set of building sites from scratch is really strong before I start implementing Bootstrap regularly. However it has become a really helpful aid when I'm not sure how to accomplish something. It has served as a very useful reference for a lot of my projects even if I don't implement the code.

Fluid Grid has to be the of the skill sets that I have struggled with the most. I know I still don't fully grasp it yet. I plan on really working on that this summer, because I know how important being able to use grid design is. I wish I was already better at it, but that's just one of my weak spots.

As for some of the other things we've gone over this semester that I know will always be a tool I'll use are implementing audio and video, adding icons, and using micro-data. I really like being able to add videos and audio to my sites, and plan to further expand my skills on what can be done with them. I've used icons on multiple projects, and know that they'll probably be used on 90% of my future projects as well. Even if it's just a Favicon. Micro-data is another topic that I'd like to research further this summer. Schema is just such a huge database, and I know that it's going to take more time for me to fully understand its capabilities.

Overall, this class has taught me several new skills. And most of them will be skills that I use repeatedly on future projects. This class has also further shown me the importance of self motivation when it comes to learning. I'm at the point now where I'm really starting to fully understand the material without constantly having to reference

something. Because of this, I have noticed myself using more features and snippets of code that I found myself outside of class. I think that in itself speaks not only of what I've learned this semester, but also of my confidence level. I hope I continue to grow, and can't wait for next semester.
